FlowForged Wheel and Tire Packages

High strength.
Light weight.
Better control.

“The wheel not only further defines a vehicle’s styling, but also affects vehicle dynamics at all times. Reduction in unsprung, rotating mass is the single biggest improvement to a vehicle’s ride and handling ability. Acceleration, steering and braking are all less work for the vehicle’s systems to accomplish.”

– Pete Callaway, Callaway Cars Inc.

Features

- Callaway 22” x 9.5” Ten-Spoke and 20” x 9.0” Nine-Spoke Wheels both feature a cast and flow-formed construction, providing a forged-strength aluminum alloy in the barrel with a cast spoke construction.

- Callaway wheels are engineered to provide high structural stiffness with minimum weight, while retaining attractive, contemporary styling. They are designed specifically to resist plastic deformation when subjected to high road forces while reduced unsprung and rotating mass improves handling and ability for the suspension to control the wheel and tire assemblies.

- Ten-Spoke Wheels are 6.1 lbs. lighter than stock, each. Nine-Spoke Wheels are 2.0 lbs. lighter than stock, each.

- Improved vehicle dynamics includes better response to braking input from high speed and reducing gyroscopic effect on steering feel.

- For more Callaway wheels information, see www.callawaycars.com/homepage/cars/wheels.
